

ABSTRACT

In one embodiment an electronic display device comprises a housing, a display area provided within the housing to display content for a user, memory within the housing to hold data that is to be rendered into user-viewable content, an electrophotographic assembly within the housing configured to electrophotographically render user-viewable content from the data that is held in the memory, a loop of material disposed proximate the electrophotographic assembly and configured to receive electrophotographically rendered content and present the content for user viewing within the display area, and a control area on the housing comprising one or more user-engagable structures to permit a user to interact with the device, the control area being positioned on the housing to accommodate one-handed use of the device.
